Surface tension in simple and easy way

🌊 Surface Tension — Simple & Easy Explanation

Surface tension is the reason why the surface of water acts like a thin elastic sheet.

🔹 What does that mean?

Water molecules attract each other (this force is called cohesion).

- Inside the water → molecules are pulled equally in all directions.
- At the surface → molecules are pulled only inward and sideways (not upward).

Because of this unbalanced pull, the surface becomes tight, like a stretched rubber sheet.

👉 That tightness is called surface tension.

🔹 Easy Real-Life Examples

1. 🐜 Insects walking on water

   Some insects can walk on water because the surface behaves like a tight sheet.
2. 💧 Water drops are round

   Water droplets form round shapes because surface tension tries to minimize surface area.
3. 🪡 Needle floating on water

   A small needle can float if placed carefully, even though it is heavier than water.

🔹 Simple Definition (Exam Style)

> Surface tension is the force that makes the surface of a liquid behave like a stretched elastic sheet due to attraction between its molecules.

🔹 Unit of Surface Tension

It is measured in:

$$\text{Newton per meter (N/m)}$$

If you want, I can also explain:

- Why soap reduces surface tension
