Explain stash and stage in git or github in simple and easy word

Here's a simple and clear explanation of *stage* and *stash* in Git:

🔹 I. Staging (Stage)

👉 What is staging?

Staging = preparing your changes before saving (commit).

Think of it like:

> 🛒 You are shopping → you pick items → put them in your cart → then go to checkout

- Your files = items
- Stage area = cart
- Commit = checkout

👉 Why use staging?

Because you can choose which changes to save.

👉 Example:

You edited 3 files but want to save only 1:

```
git add file1
```

Now:

- `file1` → staged ✅
- others → not staged ❌

Then:

```
git commit -m "save file1 changes"
```

🔹 2. Stash

👉 What is stash?

Stash = temporarily hide your changes without saving them permanently.

Think of it like:

> 📦 You are working → suddenly need to switch work → you quickly put your work in a box and come back later

👉 Why use stash?

When:

- You are working but not finished ❗
- Need to switch branch or do something else 🔄

👉 Example:

```
git stash
```

Now:

- Your changes are saved temporarily
- Your working directory becomes clean

Later:

```
git stash pop
```

👉 Your changes come back

🔥 Simple Difference

Feature	Stage	Stash
Purpose	Prepare changes for commit	Temporarily save work
Saves permanently?	Yes (after commit)	No (temporary)
Use case	Select what to commit	Pause your work

Feature	Stage	Stash
Analogy	Shopping cart 🛒	Storage box 📦

💡 Easy Memory Trick

- Stage = Select
- Stash = Store temporarily

If you want, I can also ↪ show a real step-by-step example with commands so you can practice easily 👍

Means if we don't want to push on github the change we made then we stash otherwise we stage

Not exactly — you're close, but let's fix it clearly so you don't get confused later.

✅ Correct Idea (Simple)

🔹 Staging ≠ pushing to GitHub

Staging is NOT about GitHub at all.

👉 It's only about preparing changes before commit in Git.

Flow:

```
edit → stage → commit → push (to GitHub)
```

So:

- Stage = choose what to save
- Push = send to GitHub

🔹 Stash ≠ "not pushing"

Stash is used when:

👉 You are not ready to commit at all

🔥 Correct Comparison

✅ Use Stage when:

- You want to save your work (commit)
- You are okay with making a version

👉 Example:

> "My code is ready, I want to save it"

✅ Use Stash when:

- Work is incomplete
- You need to pause and switch work

👉 Example:

> "I'm not done, but I need to switch branch quickly"

🚫 Your Statement (Fixed)

You said:

> "If we don't want to push then stash, otherwise stage"

✔ Correct version:

> "If we want to commit changes → stage
> If we are not ready to commit → stash"

💡 Super Easy Memory

- Stage → Save work
- Stash → Hide work temporarily

If you want, ↪ I can give a real-life scenario with branches (very important in exams/interviews) 👍

Means if we don't want to permanently save work and don't include changes in history then we use stash and stage is the area where changes are collected and it's upto you what you want to include in the change history

Yes 👍 — now your understanding is almost perfect, just a tiny refinement to make it 100% correct:

✅ Your Statement (Polished)

> Stash → used when we don't want to permanently save work or include it in history
> Stage → area where changes are collected, and we choose what goes into history

✔ This is correct ✔

🔍 Small but Important Clarification

🔹 Stash

- Temporarily saves changes
- ❌ Not part of commit history
- ✔ Can be restored later

👉 In Git, stash is like:

> "Pause this work, I'll continue later"

🔹 Stage (Staging Area)

- Holds selected changes before commit
- ✔ You decide what goes into history
- ✔ Only staged files get committed

👉 Think:

> "These are the exact changes I want in my history"

🔥 Final Simple Summary

- Stash = Temporary (not in history) 📦
- Stage = Selection before saving to history 🛒
- Commit = Permanently saved in history 💾

💡 One-Line Perfect Understanding

> Stash hides unfinished work, Stage prepares finished work for history

---

If you want, I can test you with a few real scenarios (like exam MCQs or practical cases) to make this crystal clear 👍
